RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 56 pages. Original publisher: Washington, D. C. : National Aeronautics and Space Administration, Office of Management, Scientific and Technical Information Division, 1989. OCLC Number: (OCoLC)26092252 Subject: Atmospheric chemistry. Excerpt: . . . Br, catalytic cycle here. The primary impact of on ozone is predicted to occur in the lower stratosphere and is coupled to C1, levels. Breakdown of methane affects ozone differently in the lower and upper stratosphere: in the lower stratosphere HO, released from CH, oxidation reacts with NO to produce more HO, ozone, while in the upper stratosphere the increased levels of (from either O, or CH, destroy directly. The importance of transport (circ) in H, O) controlling col-03 is clear from the long photochemical lifetimes of in the O, lower stratosphere, but the magnitude of the perturbation: associated with a change in the circulation has not yet been evaluated. Changes in concentrations of trace gases could change stratospheric temperatures due to the direct radiative effects of the trace gases or indirectly through their effect on change in temperature will in turn modulate the effectiveness of O, . A O, . odd-oxygen destruction mechanisms, resulting in a change in These effects have been included directly in the sensitivity factors relating ozone to the particular trace gases. For example, col-03 and upp-03 are parameterized as a function of C O 2 in spite of the fact that CO, has no direct chemical reactions in the stratosphere, because of the predicted change in stratospheric temperatures. The purpose of predicting column ozone is to calculate tropospheric changes in the solar ultraviolet radiation, which is the primary source of Further, OH. may a change in col-03 that occurs predominantly in the lower stratosphere have direct radiative...
